

Ex 2-b:

ABC commands :

```
[abc 01> read lsv/pa1/mul.blif
[abc 02> print_stats
multiplier          : i/o =   4/   4  lat =   0  nd =   4  edge =   14  cube =   8  lev = 1
[abc 02> show
[abc 02> strash
[abc 03> show
[abc 03> collapse
[abc 04> show_bdd -g
[abc 04> █
```

(3) : network structure

Network structure visualized by ABC  
Benchmark "multiplier". Time was Sat Sep 16 11:17:05 2023.

The network contains 4 logic nodes and 0 latches.

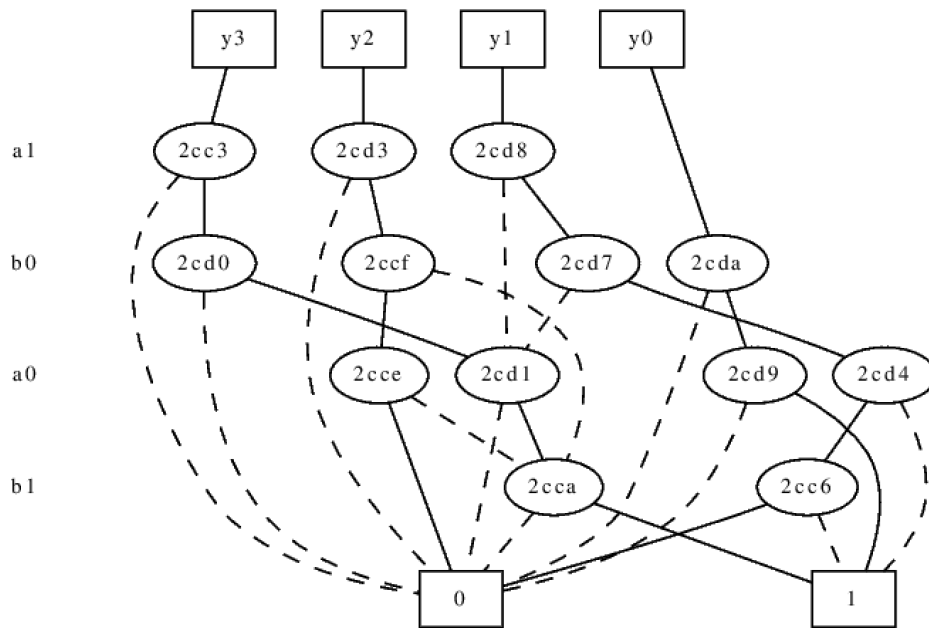

(5) : AIG

Network structure visualized by ABC  
Benchmark "multiplier". Time was Sat Sep 16 11:27:19 2023.

The network contains 18 logic nodes and 0 latches.

(7) : BDD

Ex 3 : (ref: [ABC-Berkeley](#))

(a)-1:

According to ABC official website introduction, command **aig** only transforms local functions of the nodes to AIGs, while command **strash** transforms it into an AIG by one-level structural hashing. The screenshots of the result are as follows.

Network structure visualized by ABC  
Benchmark "multiplier". Time was Sat Sep 16 11:34:36 2023.

The network contains 4 logic nodes and 0 latches.

Fig: Result of command **aig**

The network contains 18 logic nodes and 0 latches.

Fig: Result of command **strash**

(a)-2 :

Command ***bdd*** straightly converts local functions of the nodes to BDDs while command ***collapse*** recursively composes the fanin nodes into the fanout nodes resulting in a network. And that's the reason why ***collapse*** is only workable on small networks. The screenshots of the result are as follows.

Fig: Result of command ***bdd***

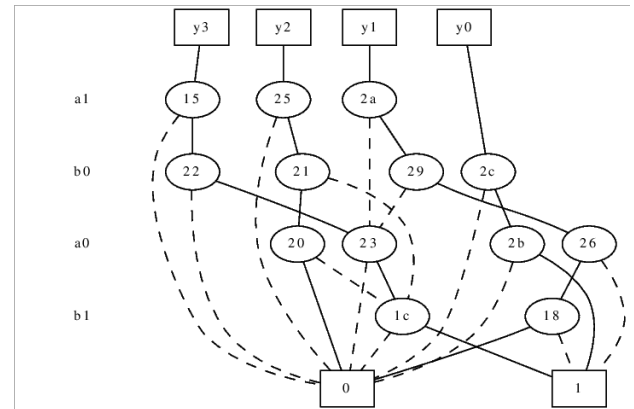

Fig: Result of command ***collapse***

(b) :

According to ABC official website, command ***logic*** can transform AIGs into a logic network with the SOP representation of the two-input AND gates.

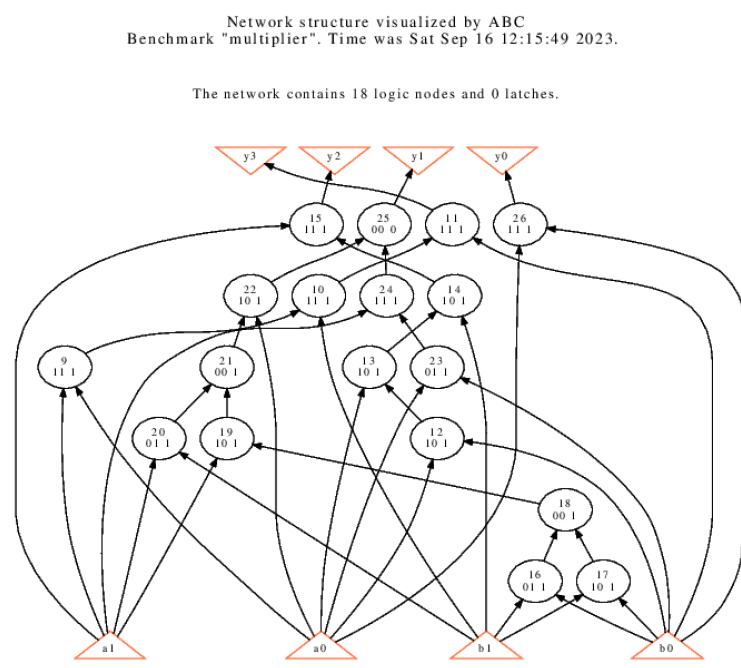

Fig: Result of command ***logic***  
followed by ***trash***.
